

Temperature monitoring for healthcare

Maintaining a constant temperature is essential for certain medical items and is of critical importance for hospitals.

RFID Discovery's automatic temperature monitoring solution can be used in any healthcare environment where maintaining a constant temperature is critical including stores for breastmilk, food, vaccines or pharmaceuticals.

It helps to ensure regulatory compliance, improve patient safety and increase operational efficiency.

The RFID Discovery system can automatically record temperature and humidity in critical environments such as vaccine stores to ensure MHRA standards are met. Removing the need for manual checks helps save time, reduce cost and eliminate errors.

Completed temperature recordings are maintained in accordance with regulatory compliance and can be archived or made available for audit or reference purposes.

The number of medicines and other healthcare items that need to be stored at a consistent temperature is constantly increasing. This growth reveals that temperature monitoring represents an important issue, both in public health and economic terms.

Consistent and reliable temperature monitoring

Our solution uses temperature sensors that communicate via a choice of different wireless radio technologies such as LoRa, BLE and Wi-Fi.

The temperature sensors transmit regular readings via an existing Wi-Fi or proprietary network into a central database.

An integrated temperature sensor can be placed into each environment that needs to be monitored. The sensor will then send temperature readings at user defined intervals.

Visualisation of temperatures in one click

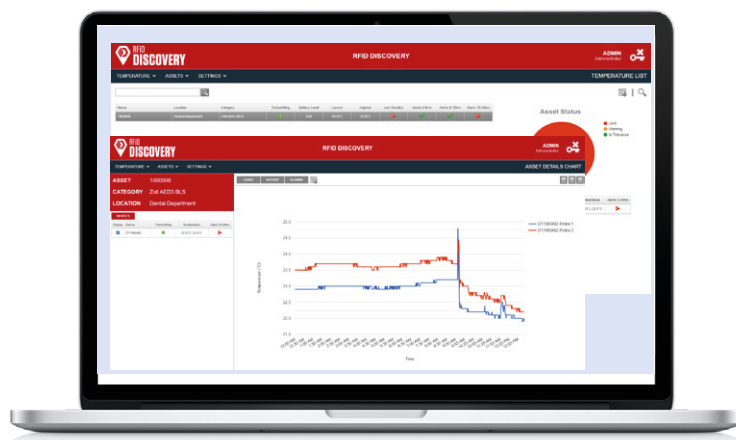

Signals from temperature sensors are picked up by a network of readers or existing Wi-Fi infrastructure and are then transferred to a central database.

For the monitoring of refrigerators and freezers, sensors with external probes are used where only the probe is in the fridge or freezer and the sensor tag remains outside to ensure that signals can be transmitted successfully to the readers. Where required, humidity can also be measured.

A simple-to-use software interface allows the user to set parameters for maximum and minimum temperatures and enable instant alerts if values are outside the specified range.

Staff can be notified in a number of different ways such as by email, audible alarm, on screen pop-up window, pager, VOIP phone, badge alert and text alert. The software interface also provides access to data for compliance reporting, auditing or analysis.

Why choose RFI Discovery?

RFI Discovery is a leading provider of integrated identification and location tracking solutions. Used in over 100 hospitals across the UK, Europe and beyond for over 15 years, RFI Discovery is the number one choice for medical device tracking and other healthcare location solutions using RFID, BLE and other technologies.

RFI Discovery is part of Paragon ID, a global leader in identification solutions, the largest manufacturer of passive RFID labels in Europe and accredited to ISO 9001.
